

This is some sample material

This is text.

This is a small heading That way, you can fit more on a page. I suppose you could use larger headings, if you want.

I'll probably compile the documents like this: `pandoc -o sample.pdf sample.md`

Unless, of course, you come up with another way (like a custom css for some pretty printable css). If you do, provide a makefile (always provide a makefile).

Also notice, the above is an example of how to write code. Also you can use code with backticks: like this: `x = x+1;`

Another heading. Interested in tables? Do it like this:

Column A	Column B	Column C
This column	This column	This column
is		
left	centered	right
justified		justified

A larger heading

This heading is larger. You can put more stuff in it.

Want lists? Do this:

- Item 1
- Item 2
- You can even have longer text in items. Then you could really define things well and provide lots of information for reference on the exam.

Some formatting

Want to format your documents? Make things *italics*, or **bold**.
